

Protecting Industrial Control Systems

Annex V. Key Findings [Deliverable – 2011-12-09]

About ENISA

The European Network and Information Security Agency (ENISA) is a centre of network and information security expertise for the EU, its member states, the private sector and Europe's citizens. ENISA works with these groups to develop advice and recommendations on good practice in information security. It assists EU member states in implementing relevant EU legislation and works to improve the resilience of Europe's critical information infrastructure and networks. ENISA seeks to enhance existing expertise in EU member states by supporting the development of cross-border communities committed to improving network and information security throughout the EU. More information about ENISA and its work can be found at <u>www.enisa.europa.eu</u>.

Contact details

For contacting ENISA or for general enquiries on CIIP & Resilience, please use the following details:

- E-mail: <u>resilience@enis.europa.eu</u>
- Internet: <u>http://www.enisa.europa.eu</u>

For questions related to industrial control systems' security, please use the following details:

• E-mail: Evangelos.Ouzounis@enisa.europa.eu

1 Key Findings

This chapter presents a more detailed view on the Key Findings presented in chapter **Error! Reference source not found.** of the main report. The following tables provide a comprehensive description including details such as:

- An impact analysis
- Stakeholders involved or affected
- Areas or fields¹ in which they may have influence.

Acad&R

1.1 The biggest challenges in ICS security

| Title | | | | | Number | | | |
|---|---|----------|----------|------------------|--------|--|--|--|
| Challenge 1: The lack of specific initiatives on ICS security 1.1 | | | | | | | | |
| Description | | | | | | | | |
| At the EU level, there are policy areas addressing Critical Infrastructure Protection and Critical Information Infrastructure Protection. However, none of them are addressing ICS specifically. COM(2011) 163 recognizes that new threats have emerged mentioning Stuxnet explicitly. However, new activities proposed by this Communication on CIIP do not include any specific to ICS. Likewise, ENISA has formally declared that after Stuxnet, currently prevailing philosophies on CIIP will have to be reconsidered. At the same time, the DHS in the USA established the Control Systems Security Program (CSSP) as a cohesive effort between government and industry to improve the security posture of control systems within the nation's critical infrastructure. | | | | | | | | |
| Impact | | | | | | | | |
| It seems that ICS security is not a key topic in CIP and CIIP plans at the EU level. Related stakeholders | | | | | | | | |
| | might not give them the necessary level of attention. | | | | | | | |

| Title | Number |
|---|--------|
| Challenge 3: The lack of an integrated management of ICS security | 1.3 |
| Description | |

It has been found, both during the desktop research and the questionnaire analysis, that one of the biggest issues that ICS operators have to face is to build security programmes that integrate all aspects of cyber security, incorporating desktop and business computing systems with industrial automation and control systems. Many organizations have fairly detailed and complete cyber security programmes for their business computer systems, but cyber security management practices are not as fully developed for ICS. Additionally, these companies normally have physical security programmes focused on preventing unauthorised access to facilities accommodating critical machinery, which is part of the process being controlled or of the ICS itself. However, nowadays many cyber attacks can be combined with physical attacks to ICT systems to which access is not restricted. These systems might not have been considered critical for the process but they might be logically interconnected with critical systems. In fact, boundaries are fading as some attacks (and risks) that needed physical action years ago may be perpetrated in the cyber space nowadays.

Impact

Not having an integral security management approach that integrates the different security flavours (i.e. physical, logical, environmental, and safety) can result in some risks being overlooked.

| Title | | | | | | Number | | |
|--|--|--|-----------|-----------|------------------|--------|--|--|
| Challenge 4: Lack of invol | Challenge 4: Lack of involvement of the Top management 1.4 | | | | | | | |
| Description | | | | | | | | |
| Operator's top Management is not considered to be involved enough in ICS logical security. Experts expressed that Top management usually consider cyber security a cost more than an investment, and that they have the wrong impression that they are already doing enough. It is essential to make them see that securing ICS is a key aspect that they should consider, also from an economical point of view (i.e. security as a business driver). | | | | | | | | |
| Impact | | | | | | | | |
| Without a clear commitment from Top Management, the security of ICS will not be appropriately managed, and in turn, the overall security of the company will result weakened. | | | | | | | | |

| Title | Title Number | | | | | | | | |
|--|----------------------------|----------|------------------|--|--|--|--|--|--|
| Challenge 5: Amortization of ICS investments 1. | | | | | | | | | |
| Description | | | | | | | | | |
| ICS systems technology has been developed, in many cases, for a very specific purpose use and its implementation is different for each use case. This in turn has implied high investments from operators that are normally amortized during the next 15-20 years, or even longer. Most of these components do not include appropriate security mechanisms to protect them from today's threats and even less from tomorrows'. As a result, security staff will have to deal with ICS with little or no security capabilities for the next $10 - 15$ years, and this will have to be taken into account when designing security plans. | | | | | | | | | |
| Impact | | | | | | | | | |
| The ICS market would have to deal with this issue at least for the following decade. Compensatory security controls will have to be developed. | | | | | | | | | |

| Title | Number |
|--|--------------|
| Challenge 6: A long path for ICT security tools and services providers | 1.6 |
| Description | |
| Traditional ICT security companies have tried to penetrate the control and automation recent years. However, the ICS world is different from classic ICT systems and there are cha force them to adapt existing (or even create new) solutions and services. A fundamental different are the services are created by a solution of the service o | llenges that |

the very basic guiding principles. The ruling security paradigm in classic ICT systems is based on the CIA model (Confidentiality, Integrity, Availability), but in the ICS environment what rules is the SRA model (Safety, Reliability, Availability). As a result, even though many security strategies, technologies and services may be exported from one world to the other, a much deeper reflection and ICS-oriented training in the ICT security industry, is required.

| m | p | а | ct |
|---|---|---|----|

There is a need to further reconsider classic ICT security solutions and services, so that they can really help securing ICS.

| Title | Number |
|---|--------------|
| Challenge 7: Adaptive Persistent Adversaries as the threat of the future. | 1.7 |
| Description | |
| As ICS systems are often behind Critical Infrastructures, many self-organized, well sup technically skilled adversaries may see ICS as the perfect target to sabotage for many possi (e.g. terrorist attack, unfair competition, etc.). Terrorists, criminal organizations, rival | ible reasons |
| foreign states or independent groups can make use of different means (e.g. ad-hoc malv | ware, highly |

qualified hackers, etc.) to attack these systems thanks to the increasing integration with ICT technology and other corporate systems. This is an increasing phenomenon (e.g. Stuxnet, Night Dragon) and most experts think it will grow during the following years.

Impact

Econom.

Technic.

Adaptive Persistent Adversaries are a formidable threat that can make much harm and require intelligent security measures to be implemented.

| Challenge 8: The security technical challenges of the SmartGrid: size, third party networks and customer privacy. | | | | | | | |
| Description | | | | | | | |
| The most challenging security factors of the adoption of the Smart Grid have been identified as: the overwhelming size of the networks, the trustfulness of third party networks for data transmission, and how to guarantee end customer privacy. Additionally, security challenges were commonly related to the deployment of secure smart meters. The remote control of these devices, together with a higher number of interdependencies and a distribution of control are considered factors that might increase the probability of weak points and cascade effects. | | | | | | | |
| Impact | | | | | | | |
| All involved stakeholders (manufacturers, telecommunication companies, operators, and end-users) will have to deal with security problems. | | | | | | | |

Description

Some of the documents studied during the Desktop Research phase focus on specific sectors, with the

Energy sector (including oil, gas and electricity subsectors) being the most active one. Moreover, inside the Energy sector, it is the electricity subsector the one which presents, by far, the largest number of specific guidelines, standards and regulatory documents.

Impact

Comparing to other sectors, the Energy sector counts with a good number of reference ICS security standards and guidelines.

| Implementation of non European regulations, standards or best practices in industrial environments. | 3.6 |
| Description | |
| International standards such as ISO 27002 or United States' guidelines are being follow Moreover, companies are starting to comply with different aspects considered in regulation | • |

not to be applied in Europe, probably as a result of a lack of leadership by European authorities.

Some sectors are already starting projects to improve the security of their ICS due to the fact that there are specific regulations in place in the USA, like the NERC CIP standards for the bulk electricity transportation or the NRG 5.71 for nuclear power plants. However, there are other sectors that seem to be waiting for a specific mandate from public organisations before proceeding with these tasks. **Impact**

The lack of reference guidelines and trying to comply with non-European regulations might result in not optimal investments.

Protecting Industrial Control Systems

Annex V. Key Findings

| Title | Number |
|---|--------|
| Manufacturers' negative attitude towards best practices and standards | 3.9 |
| Description | |

Manufacturers participating in the survey and interviews have very little interested or even show a negative attitude towards most security standards of the industry. Some experts stated that since vendors are global companies, they are not strongly influenced by unilateral efforts and suggested that a joint European approach could be useful. ENISA was seen as an appropriate organisation to do so.

Impact

Manufactures seem to work independently, driven by market conditions. If the reasons behind are not understood and taken into consideration the whole community may lack the contribution of a very important stakeholder.

| The need for a European ICS security good practices documents 3.12 | | | | | | | |
| Description | | | | | | | |
| A majority of respondents consider that it is important, even urgent, to have a European collection of documents on ICS security good practices. Most respondents spontaneously said that it is not necessary to "reinvent the wheel" and it would be desireble to cooperate with European Member States, the US, Asia or Oceania to quickly put together a collection of European ICS security good practices. However, there are some experts that do not feel comfortable with cooperating with USA organisations. Furthermore, cooperation within Eruopean affected stakeholders will be much appreciated. Several respondents pointed to ENISA and Euro-SCSIE as catalyst organisations to create/compile a collection of ICS security good practices. | | | | | | | |

| Security plans need to be adapted for every operator | 4.5 | | | | |
| Description | | | | | |
| ICS usually consist of highly specialised deployments, designed for very specific purposes and to fulfil | | | | | |

ics usually consist of highly specialised deployments, designed for very specific purposes and to fulfil very precise requirements. Security projects deriving from the security plan normally include the implementation of technical, operational and management security controls. These controls should be

tailored for each ICS since their applicability differ widely from their classic IT counterparts. Some examples of security controls that need some tailoring are: account management, separation of duties, least privilege principle, concurrent session control, remote access, auditable events, configuration change control, contingency plan testing and exercises, maintenance tools, remote maintenance, malicious code protection, security functionality verification, etc

Impact

The creation of such a template could facilitate the adoption of complete and comprehensive security plans within ICS infrastructures.

1.6 Public Private Partnerships

| Title | Number |
|--|---------------|
| PPP sharing initiatives demanded by most stakeholders. | 6.1 |
| Description | |
| The majority of experts believe that public-private information sharing and collaboration in | itiatives are |
| useful and necessary, as eventually they will lead to the improvement of the situation | in the ICS |

useful and necessary, as eventually they will lead to the improvement of the situation in the ICS security domain, even if they show different, sometimes contradictory, interests. Some experts even consider that without a facilitator (i.e. public sector), it is unlikely that private companies will get together. It is interesting however to highlight that both Manufacturers and Security Tools and Services Providers prefer other mechanisms to address ICS security challenges.

In addition to usual sharing initiatives, public support can help long term funding, which is not always evident for companies, usually looking for short-term results and where true costs can be initially underestimated.

Impact

It is important to acknowledge that the role of the public sector is considered to be a key factor for the success of these kind of initiatives.

| costs before the Top Management. There is a current of opinion that states that it has to be presented | | | | | |
| as a bussines driver, providing economic reasons such as that, if considered during the P | DCA cvcle. it | | | | |

Public B.

Acad&R

can be good for efficiency purposes.

Incidents in industrial control systems should serve as a basis for risk assessment updates and to lead corrective measures and reprioritising resource allocation. Organisations should address the challenge of establishing a group that meets regularly to discuss incidents and risks. This group should evaluate how these risks could impact security in the organisation's control systems. It should be composed by representatives from Management as well as from process control and IT".

Impact

Security costs must be understood by Top Management, otherwise security may not be properly taken into account.

| Level | | Stakeholder Type | | | References | |
|-------|--|------------------|--------|-----------|------------|-----------------------|
| | | Aware. | Man∬ | ICS Sec. | Operator | Survey&Interview (23) |
| | | | Acad&R | Public B. | | |
| | | | | | | |

| Title | Number |
|---|--------|
| Discussion on technology-centric forums | 8.5 |
| Description | |

A few experts stated that Dissemination and Awareness forums do focus too much on security technologies or generic security aspects, not giving enough attention to the Bussines aspects, such as the specific ICS implementations used in different activity sectors. Moreover, technologies may be adapted for several functionalities, but specific issues come from productivity and business objectives. Therefore, there is a need for dissemination and awareness initiatives focusing on specific activity sectors and which consider technology as an horizontal subject.

Impact

By following the previous suggestions, involving Senior Management and solving security problems could be more successful.

Title

PPP and cross-border as desired characteristics of an ICS-computer emergency response g.2 (9.2)

Description

Most respondents think that the ICS-computer emergency response capability should be operational on the cross-border level as well as on the national. It should be connected to the national/governmental CERT baseline capabilities and able in to cooperate on the Pan-European level, in order to address the challenges which span across the borders. It should be promoted by ENISA. Respondents proposed that some of the activities of the ICS-computer emergency response capability could be providing guidelines and a vulnerability model.

Impact

A common reference in Europe would be welcome.

| ICS security | / "taken i | n their | own | hands" |
|--------------|------------|---------|-----|--------|

Description

Title

Operators normally rely on third parties on issues that are not considered their core business for efficiency reasons. However, this is not the case as far as the ICS security is concerned. **Impact**

Number 10.2

ICS are behind the most critical parts of the core business of many CI operators. Therefore, operators might not be willing to subcontract their protection (i.e. not to reveal critical information to third-party companies). However, this might also be interpreted as a measure of the maturity level of ICS protection. As it is clear from other Key Findings, operators are still in the first stages of implementing ICS security controls: performing a risk analysis, defining security plans, or starting to implement some of the projects of the plan.

| Title | Number |
|--|--------|
| Discrepancies within most demanded/acquired security services. | 10.5 |
| Description | |

Description

According to the survey, developing cyber security plans, performing penetration tests and risk analysis are the most recommended security services for the Operators. At the same time, Operators declare that they are only demanding security network (re)design and penetration tests. On the contrary, ICS Security Services Providers are providing risk analysis, security products deployment, compliance audits and host bastioning.

Impact

Operators are recommended to use services that they declare to be rarely using. Moreover, ICS security service providers are providing services that Operators are not aware of. This discrepancy might be due to the fact that many of the security services are part of the whole ICS deployment contract signed between the ICS vendor and the operator. Operators are not really aware that the ICS systems they are acquiring already come with security products (e.g. firewalls, IDS/IPS, etc.) or hardenned against security threats. It is the ICS Manufacturer that demands part of the security services to ICS tools and Services providers.

| Title | Number |
|---|--------|
| Legacy devices working under invalide assumptions. Long lifecycle of ICS. | 11.2 |

Description

Obsolete technologies were designed with invalid assumptions such as "devices are isolated", or "these systems are only understood by a small number of experts". These assumptions are no longer true. Built-in security is the best approach for protectin these systems, but for economical reasons a compensating, multi-layer approach is being implemented in most networks. The situation is worsened by the fact that ICS technologies lifecycle is much longer than the usual ICT lifecycles. As a result, many current ICS systems may remain vulnerable for longer.

Impact

Many working devices are not prepared to face current cyber security threats.

| Title | Number |
|--------------------------|--------|
| Built-in security needed | 11.3 |
| Description | |

Security requirements should be included in system specifications from the beginning. It is always much more difficult and expensive to implement compensating controls that solve the security deficiencies of these products designed and developed with no security requirements in their specifications. Often this is impossible, since many of the 'old' solutions do not have enough computing resources available to accommodate current security mechanisms. Additionally, third-party security solutions are not allowed due to ICS vendor license and service agreements.

Impact

If security is not taken into account from the beginning more expensive compensating solutions are needed.

1.12 ICT and ICS convergence problems

| Title | | | | | | | Number | |
|---|--------------|----------------|---------------|-----------------|---------------|---|--------|--|
| ICS import | ing the ICT | solutions ar | nd the ICT pr | oblems | | | 12.1 | |
| Descriptio | n | | | | | | | |
| During the last few years ICT solutions have been becoming more and more common in ICS environments. Field devices have evolved from mechanical to electronic, relays have been replaced with microprocessors, computer operating systems and high level programming languages have been introduced to ICS. Control systems used to be built up on proprietary software but now many of them utilise standard applications or OS, or use IT systems such as TCP/IP networks. With this adoption of ICT solutions, ICS have also inherited their vulnerabilities. Additionally the increased complexity of software raises the likelihood of implementation flaws (such as software bugs). | | | | | | | | |

| ICT staff does correctly understand ICS requirements | 12.3 |
| Description | |

A common problem mentioned by the ICS Security respondents was to make the ICT personnel (often in their own companies) properly understand the real needs and requirements of ICS environments. Some approaches regularly used in the ICT context can have catastrophic consequences if applied to ICS environments. Proper education must be given.

Impact

If ICT and ICS staff are not able to work collaborately it is unlikely that they will be able to reach unified and appropriate solutions for their problems.

| 4 |
|---|
| |
| |

Many ICS software and hardware vendors are not aware of programming good practices and methodologies. Penetration tests and white box audits, in controlled laboratories, have shown that there are basic security bugs in devices and applications that could be properly identified if security development good practices were included in the development cycle.

Impact

If ICS logical security responsible staff do not self-adapt to the new ICT security requirements they could neglect actual risks.

| | | | | | | | | | | | |
| Title | | | | | | | Number | | | | |
| Future research lines | | | | | | | 14.2 | | | | |

Description

During the next few years, research lines are planned to focus on: more robust and flexible architectures, early anomaly detection by Network Behaviour Analysis (NBA) and Security Information and Event Management (SIEM) systems, patching and updating equipment without disruption to service and tools, methodologies to manage and integrate logic and physical threats, and improve forensic techniques for supporting criminal law enforcement.

Impact

Future research should focus on ICS specific problems. This means that direct application of ICT solutions and techniques is not enough anymore. This is particularly true for targeted attacks detection and response.

1.15 Pending debates on ICS security and other related issues

| Title | | | | | | | Number |
|---|--------------|---------------|---------------------|-----------|-----------|--------------------|---------|
| The securi | ty by obscu | rity debate | | | | | 15.1 |
| Descriptio | n | | | | | | |
| There is a strong debate about the suitability of the "security by obscurity" approach. Many manufacturers and some other experts in different fields believe that this security philosophy is correct and even necessary. On the other hand, most ICT specialists and academia consider this is not an acceptable practice. For example, Standardization groups consider that the Industry should adopt a single cryptographic system rather than a diverse mix of systems that have not undergone public expert review. The system should be flexible to permit the introduction of new algorithms (ciphers) and new technologies after they are validated to be cryptographically secure. Impact If there is no general agreement both approaches will coexist, which can cause problems if one is | | | | | | | |

| Title | Number |
|---|--------|
| Reasons againts regulation enforcement by penalties | 15.3 |
| Description | |

Several experts stated that it is not in the European culture to apply a regulatory approach, and that Good Practices and Standards should be used instead. Some pointed out that being compliant does not always mean being secure, with the former often being the only objective of Senior Management. They brought up the example of US companies trying to bypass the regulation and, hence, compromising security.

Impact

Regulation enforcement by fines does not guarantee ICS to be secure and even could compromise theri security in various ways.
